Chapter 1

The Ant Colony Optimization Algorithms

This is the main source code repository for [Ant Colony Optimization Algorithms]. It contains the standard library, and documentation.

Installing from Source

Building on *nix

1. Make sure you have installed the dependencies:

- `g++ 4.7 or later` or `clang++ 3.x or later`
- `GNU make 3.81 or later`
- `cmake 3.4.3 or later`
- `OpenMP`
- `git`

2. Clone the `source` with `git`:

```
$ git clone https://github.com/Omgix/ant-colony
$ cd ant-colony
```

1. Build and install:

```
```sh $ cmake ./ && sudo make ```
```

> **Note:** Install config can be adjusted by edit the `cmake` file

### Building Documentation

If you'd like to build the documentation, it's almost the same:

```
$ doxygen .\Doxyfile
```

The generated documentation will appear under the `ant-colony` directory for the ABI used.

## Chapter 2

# Class Index

### 2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">AntColonyBase</a> . . . . .	7
-----------------------------------------	---

## Chapter 3

# File Index

### 3.1 File List

Here is a list of all files with brief descriptions:

<a href="#">AntColonyBase.cpp</a> . . . . .	11
<a href="#">AntColonyBase.h</a> . . . . .	12

## Chapter 4

# Class Documentation

### 4.1 AntColonyBase Class Reference

```
#include <AntColonyBase.h>
```

#### Public Member Functions

- [AntColonyBase](#) (const char \*filename, double alpha=15, double beta=20, double rho=0.1, double colony\_eff=1.0, unsigned maxiter=500)  
*brief : Read file to get dimension and points coord.*
- [AntColonyBase](#) (const std::string &filename, double alpha=15, double beta=20, double rho=0.1, double colony\_eff=1.0, unsigned maxiter=500)
- [AntColonyBase](#) (const [AntColonyBase](#) &)=delete
- [AntColonyBase](#) & [operator=](#) (const [AntColonyBase](#) &)=delete
- int [calcTSP](#) ()
- int [recalcTSP](#) ()  
*If the optimal tour not calculated, calculate and store the result that can be gotten by [getpath\(\)](#)*
- std::deque< int > & [get\\_path](#) ()  
*Similar to [calcTSP\(\)](#), but calculate anyway;.*
- std::deque< double > & [get\\_mintour\\_each](#) ()  
*Get the result (after calculating)*
- std::deque< double > & [get\\_mintour\\_global](#) ()  
*Get the length of minimal tour in each iterations.*
- void [printAdj](#) (std::ostream &os)  
*Get the length of minimal tour until each iteration.*
- double [total\\_len](#) ()  
*Print adjacent matrix in OS.*

#### 4.1.1 Constructor & Destructor Documentation

#### 4.1.1.1 AntColonyBase() [1/3]

```
AntColonyBase::AntColonyBase (
 const char * filename,
 double alpha = 15,
 double beta = 20,
 double rho = 0.1,
 double colony_eff = 1.0,
 unsigned maxiter = 500) [explicit]
```

brief : Read file to get dimension and points coord.

param : filename is the tsp\_file you want to caculate. retval : the number of print information, in bytes. return zero indicate print error ! Note:

#### 4.1.1.2 AntColonyBase() [2/3]

```
AntColonyBase::AntColonyBase (
 const std::string & filename,
 double alpha = 15,
 double beta = 20,
 double rho = 0.1,
 double colony_eff = 1.0,
 unsigned maxiter = 500) [explicit]
```

#### 4.1.1.3 AntColonyBase() [3/3]

```
AntColonyBase::AntColonyBase (
 const AntColonyBase &) [delete]
```

### 4.1.2 Member Function Documentation

#### 4.1.2.1 calcTSP()

```
int AntColonyBase::calcTSP ()
```

#### 4.1.2.2 get\_mintour\_each()

```
std::deque< double > & AntColonyBase::get_mintour_each ()
```

Get the result (after calculating)

brief : Get the local shortest path 's length

param : the path retval : double ,which is the the local shortest path 's length

#### 4.1.2.3 get\_mintour\_global()

```
std::deque< double > & AntColonyBase::get_mintour_global ()
```

Get the length of minimal tour in each iterations.

brief : Get the global shortest path 's length

param : the path retval : double ,which is the the global shortest path 's length

#### 4.1.2.4 get\_path()

```
std::deque< int > & AntColonyBase::get_path ()
```

Similar to [calcTSP\(\)](#), but calculate anyway;.

brief : Get the shortest path

param : the Caculation retval : deque<int> ,which is the city's node

#### 4.1.2.5 operator=()

```
AntColonyBase& AntColonyBase::operator= (
 const AntColonyBase &) [delete]
```

#### 4.1.2.6 printAdj()

```
void AntColonyBase::printAdj (
 std::ostream & os)
```

Get the length of minimal tour until each iteration.

#### 4.1.2.7 recalTSP()

```
int AntColonyBase::recalTSP ()
```

If the optimal tour not calculated, calculate and store the result that can be gotten by getpath()

brief : Caculate the shortest path

param : None retval : 0 Calculate success ; -1 Fail, max iterations reach. int NMax—>max citys

int m—>number of ants

double Q—>flexible

MatrixXd phe—>Pheromone

int ant—>Ant's current locatioe

int i j k p —>loop variables

min\_L —>Minimal tour in all iterations

min\_path—>Path of minimal tour in all iterations

deltaphe—>Pheromone that will be added in the next iteration

min\_L\_local—>Minimal tour in the current iterations

Note:For each ant, perform a loop

Passed—>Used to determine if the city has passed, can it be selected

deltaphesingle—>Part of pheromone that will be added in the next

LK—>Total length of tour of the current ant

path—>Path of tour of the current ant

start—>Choose the start point randomly.

discrete\_distribution—>Construct a generator with the given probability;

next—>Choose next city to visit;

omp—>Only one thread can update the information of the minimal tour.

phe—>After each cycle, update the pheromone.

#### 4.1.2.8 total\_len()

```
double AntColonyBase::total_len ()
```

Print adjacent matrix in OS.

brief : Caculate any path 's length

param : the path retval : double ,which is the the path 's length

The documentation for this class was generated from the following files:

- [AntColonyBase.h](#)
- [AntColonyBase.cpp](#)

## Chapter 5

# File Documentation

### 5.1 AntColonyBase.cpp File Reference

```
#include "AntColonyBase.h"
#include <atomic>
#include <cmath>
#include <chrono>
#include <fstream>
#include <random>
#include <sstream>
#include <string>
#include <iostream>
```

#### 5.1.1 Detailed Description

[AntColonyBase](#) data(argv[1]); data.calcTSP();
